

The Catholic Medical Association supports your right to know. In 1960, developers of hormonal contraceptives promoted the pill as a miracle drug that would improve women's lives. However, the pill has **major side effects - weight gain, depression, stroke, and even death!** Hormonal contraception can be an abortifacient when ovulation is not suppressed and an embryo cannot implant on the thin uterine lining. Also, medical studies indicate that **women who use the pill** for at least **four years** prior to having their first baby have a **52% higher risk of developing breast cancer**. In addition, modern methods of Natural Family Planning are **highly effective** in **delaying** pregnancy, with no harmful effects. They can also be used to achieve pregnancy & address **G-Y-N** issues, such as infertility, abnormal bleeding and PMS. Learn more at CathMed.org. **Sponsored by the Pro-Life Educational Foundation.**
